**Uittreksel**

The information carrier which is constructed as a plug-on sign consists of a plug-in element (1) and a sign (2) which are constructed as two individual components intended to be joined. For this purpose, the sign (2) can be inserted into a slot on the upper edge, lying opposite the tip (3) of the plug-in spike (4), of the plug-in element (1). This permits the plug-in element (1) and sign (2) to be produced from different materials or from the same material with different properties, which permits individual adaptation to the different requirements of plug-in element and sign.
